

C-24 Bloodborne Pathogen Exposure Control Plan

I. Introduction

The NCI-Frederick Biological Safety Program assures compliance with the OSHA (Occupational Safety and Health Administration) Bloodborne Pathogen standard 1910.1030 and the Exposure Control Plan, in addition to SAIC-Frederick, Inc. operational requirements. Although compliance issues command a great deal of emphasis, the basic philosophy of the NCI-Frederick Biological Safety Program is to provide a safe working environment for all individuals using bloodborne pathogens and/or human blood, bodily fluids and other potentially infectious materials.

Program components such as IBC registration, safety training, medical surveillance programs, and waste management procedures are designed and executed to ensure that regulatory requirements are being met.

While the technical services of the NCI-Frederick Biological Safety Program are an important element of the overall NCI-Frederick biological safety effort, the ultimate success of this effort can only be accomplished through cooperation and commitment on the part of everyone involved in the use of human blood, bodily fluids, and other potentially infectious materials.

II. Scope

All individuals working with or having the potential for occupational exposure to human blood, bodily fluids or other potentially infectious materials must adhere to the policies and procedures found in the following documents:
